~$ Daniel Luca

CTO @ STEALTH STARTUP | TECHNICAL PARTNER @ EDEN BLOCK | OPEN-SOURCE PROJECTS

X / Twitter GitHub LinkedIn cleanunicorn.github.io Bucharest, Romania

I am Daniel Luca (aka CleanUnicorn), based in Bucharest, Romania — a **builder**, a **hacker** and an **extropian**.

Builder — I have been shipping software since 2008, and most of what I make is open source and starts as something I wanted to exist. **Hacker** — I take systems apart to see where they give, and I have been doing that on Ethereum since 2017. **Extropian** — I bet on progress: on technology, open systems and the people willing to build them, over pessimism and over hype.

I care about open source, security, and getting the details right. I favour trust-minimized architectures and adversarial code review: systems that hold up under attack, not ones that ride a narrative.

CTO at a stealth startup — since August 2026. The company has not announced itself yet; details once it launches.

Technical Partner at Eden Block — I build and improve our internal processes — we are tech driven in this approach — and run the technical evaluation behind early-stage investments.

Open-source projects — tools people run: Earheart for private, on-device dictation, Agents Library for coding agents that open reviewable pull requests, drove for running local LLMs, Karl for hunting live smart-contract exploits, and the RL-Swarm contracts behind Gensyn's first public launch. The full list is below.

Security research — I audit Ethereum smart contracts through Akira Tech, and before that at ConsenSys Diligence on Uniswap, Aave, Filecoin and Polygon.

Whether I'm writing a contract, breaking one or evaluating a seed round, **the lens is the same — open source, sound engineering and long-term fundamentals over hype.**

EXPERIENCE

CTO · Stealth Startup

August 2026 — Present

A startup that has not announced itself yet — details once it launches.

Technical Partner · Eden Block

November 2022 – Present

Technical diligence and research partner at Eden Block, an early-stage VC backing blockchain, Web3 infrastructure and decentralized AI. I run the technical evaluation behind investment decisions and work hands-on with founders on architecture, security and product — from first check through scaling — helping shape the firm's research-driven approach.

portfolio: Gensyn — helped launch their testnet · Biconomy · Fair · Hypurrfi · Novel Labs · Nym · Vega Protocol

Co-Founder · FiatDAO

November 2021 · Deployed April 2022

Co-founded and built FiatDAO, a decentralized autonomous organization (DAO) focused on DeFi tools for fixed-income assets on Ethereum. Helped design and build the platform, letting users use their fixed-income positions as collateral to access liquidity and mint stablecoins. Worked on protocol development, governance, and smart contract security, partnering with a global team to launch and improve the product.

Founder, Security Researcher · Akira Tech

October 2020 – Present

Founded Akira Tech as a specialized security shop with a focus on comprehensive security audits, code reviews, and cyber risk assessments for blockchain and software projects. Led technical engagements with clients, identifying vulnerabilities and recommending actionable solutions to improve system security. Delivered security reports and collaborated with development teams to implement best practices for secure smart contract development.

Security Researcher · ConsenSys Diligence

November 2018 – August 2020

As part of ConsenSys Diligence — a leading smart-contract audit and Ethereum security team — I delivered security audits and consulting for some of the most widely used protocols on Ethereum, and pursued security research and conference talks alongside the engagements.

selected audits: Uniswap - popular DEX (decentralized exchange) platform written in Vyper · Aave - governance and token issuance · Aragon - multiple apps reviewed · OmiseGo - plasma implementation · Matic/Polygon - PoS blockchain (geth fork) and migration mechanism · Filecoin - decentralized storage network · Shell Protocol - stable coin DeFi · Horizon Games - ERC 721 and marketplace

Developer · Alethio (ConsenSys)

February 2017 – November 2018

Alethio was a ConsenSys spoke building analytics for the Ethereum blockchain. I built most of the data pipeline that extracts on-chain data, applies an ontology and imports it into multiple databases — the foundation powering Alethio's analytics products.

// EARLIER

Cofounder / CTO · Fitpass — Cofounded and built the product, backend and frontend. May 2016 – December 2017

Cofounder / CTO · Lendia — Cofounded and built the product. February 2015 – December 2016

Owner · ElasticOrange — ElasticOrange was a software company that developed products for international clients. October 2014 – January 2017

Developer · Filebox (Synco Telecom) — We designed the complete software stack, as well as maintained the hardware powering all of it. May 2008 – September 2010

SKILLS

SECURITY	Smart Contract Auditing · Vulnerability Research · Penetration Testing · Threat Modeling · Incident Response
BLOCKCHAIN	Ethereum · Solidity · Vyper · EVM Internals · DeFi Protocols · Foundry · Hardhat
LANGUAGES	Python · JavaScript · TypeScript · Node.js · Go
AI	LLM Engineering · RAG Systems · Vector Databases · Prompt Engineering
INFRASTRUCTURE	Linux · Docker · CI/CD · Git · RTMP Streaming
VENTURE CAPITAL	Technical Due Diligence · Deal Sourcing · Portfolio Support · Research-Driven Investing

SELECTED PROJECTS

Earheart — Private, hotkey-driven voice dictation for Windows, macOS and Linux — with the default local models, speech-to-text and LLM cleanup run in-process on your own machine. Hosted providers are optional.

Agents Library — Stack-agnostic coding agents and review skills for Claude Code and Codex — each one makes a single focused change per run and opens a reviewable pull request.

drove — Local LLM infrastructure in one tool — a llama.cpp server manager, chat interface, observability proxy and model manager.

Karl — My security research, productized: it monitors live Ethereum smart contracts and tests them against vulnerabilities with Mythril, forking the chain to confirm real exploits and cut false positives.

RL-Swarm Smart Contracts — The smart contracts powering **Gensyn**'s **RL Swarm** — a distributed reinforcement-learning system that lets anyone, anywhere, join and train models that learn faster together than alone. Built for their first public launch.

TALKS & PRESENTATIONS

2025 **ETHCluj** — Beyond "Trust me, bro" Engineering LLM reliability

2025 **Cypherpunk Congress #1** — The Privacy paradox in AI

2024 **NFTBucharest** — Decyphering the Bitcoin Ordinals Giant Mess

2024 **ETHBucharest** — Doppelganger Networks

2023 **ETHPrague** — Elevating Developer Experience(DX) in Web3

2023 **EthCC** — Elevating Developer Experience(DX) in Web3

2022 Onchain games for devs

2020 **EthCC** — The Ether Wars: Exploits, counter-exploits and honeypots on Ethereum part 2

2019 **DefCon 27** — The Ether Wars: Exploits, counter-exploits and honeypots on Ethereum

BlockchainHackers IV — Mastering Ethereum CTFs

The Bitcoin Podcast: #283 Daniel Luca — ConsenSys Diligence

Security Espresso Meetup 0×13 — Ethereum the Hacker's Paradise

PODCASTS

2025 Decentralized AI: The Next Shift - Daniel Luca

2025 The Code Is Law Movie, The DAO and Indexed Finance Heists, Crypto Culture

2024 How VCs invest in crypto

EDUCATION & COMMUNITY

Self-taught builder and engineer — depth built through open source, security research and shipping production systems since 2008.

Blockchain Workshops, Bucharest *(Since 2018)* — Developed and held a series of long format workshops which cover the basics of blockchain, Solidity, EVM, private chains setup, consensus algorithms, smart contract design and other related topics.
